I am a software engineer with 6 years of experience in designing and building scalable, fault-tolerant platforms using microservice architecture. Along with demonstrated hands-on experience in building distributed streaming platforms for near-realtime data processing.

Work Experience

Software Engineer III — **Super.Money (by Flipkart)** | Bangalore, IN — **Feb 2025–Present**

- Introduced & deployed a modern API gateway, **Kong**, migrating from a bloated legacy service, and scaled to serve **~15k rps.**
- Designed and enhanced custom capabilities of the API gateway, including auth, security, and rate limiting.
- Designed and implemented login and authentication flow for web users onboarding, serving **50k users** every month.
- Engineered and led the data streaming pipeline as a platform, to extract features using **Flink** and served using feast(opensource), which is used by UPI system it to **detect frauds.** Processing **~2100** events per sec. Helped other teams to onboard their use case on the platform.

Software Engineer II — **CRED** | Bangalore, IN — **Nov 2022–Feb 2025**

Bankstack: Building digital banking platform that serves **10M+** users with diverse financial products like CC, BNPL, TL etc.

- Built microservices using Java, Google Guice DI and gRPC for low latency and high throughput.
- Built platform for BNPL (buy now, pay later) and term loans by collaborating with cross-functional teams.
- Designed and implemented the multi-tenant fee module that processes **4B+** transactions every month.
- Lead the development of processing repayment transactions async using CRON job, databricks & AWS SQS.
- Spearheaded 0 to 1 product called loan against securities, owning and delivering multiple features like create loan, foreclosure, interest accrual that serves **8M+** users.
- Analyzed and optimized CPU, memory, and **JAVA_OPTS** for multiple services, achieving **31%** AWS ECS cost savings.
- Mentored an intern to implement REST API wrapper for loan platform APIs and loan account lifecycle.

Software Engineer I — **CRED** | Bangalore, IN — **July 2020–Nov 2022**

- Used spring-boot microservice and velocity lib to build config-driven API response that serves **23K req/min**.
- Migrated from SQL to DynamoDb schema for decoupling configs which improved reusability & extensibility.
- Designed and developed APIs for showcasing unbilled transactions of credit cards of the user.
- Used locust for load testing microservices for **10K req/sec** and tweaked downstream API timeouts for critical flows.
- Designed and built flows for showcasing bank offers for credit-cards serving over **6M+** users.

SDE Intern — **CRED** | Bangalore, IN — **Jan 2020–Jul 2020**

- Working with the Backend Team and using Spring Boot framework.
- Used resilence4j lib for circuit breaks to prevent cascading failures due to failure in downstream services.

Education and Certifications

- **Govind Ballav Pant Engineering College, New Delhi** — **2016–2020**
  B.Tech. in Computer Science | CGPA: 7.4

Technologies and Languages

- Languages & Framework: Java(SpringBoot, Guice DI), C++, Python, flink
- Databases & Technologies: MySQL, DynamoDb, Kafka, AWS SQS, S3, gRPC
- Other: API designing, Reliability, fault tolerance
